ITCH

MECHANISMS AND TREATMENT

CRC Press Advances in itch research have elucidated differences between itch and pain but have also blurred the distinction between them. There is a long debate about how somatic sensations including touch, pain, itch, and temperature sensitivity are encoded by the nervous system. Research suggests that each sensory modality is processed along a fixed, direct-line communication system from the skin to the brain. Itch: Mechanisms and Treatment presents a timely update on all aspects of itch research and the clinical treatment of itch that accompanies many dermatological conditions including psoriasis, neuropathic itch, cutaneous t-cells lymphomas, and systemic diseases such as kidney and liver disease and cancer. Composed of contributions from distinguished researchers around the world, the book explores topics such as: Neuropathic itch Peripheral neuronal mechanism of itch The role of PAR-2 in neuroimmune communication and itch Mrgprs as itch receptors The role of interleukin-31 and oncostatin M in itch and neuroimmune communication Spinal coding of itch and pain Spinal microcircuits and the regulation of itch Examining new findings on

cellular and molecular mechanisms, the book is a compendium of the most current research on itch, its prevalence in society, and the problems associated with treatment.

ROOK'S TEXTBOOK OF DERMATOLOGY

John Wiley & Sons The late Arthur Rook established the Textbook of Dermatology as the most comprehensive work of reference available to the dermatologist and it enjoys instant name recognition. Each subsequent edition has been expanded as the subject has developed and the book remains the ultimate source of clinical information for the trainee and practising dermatologist alike. Rook's Textbook of Dermatology covers all aspects of skin disease from basic science through pathology and epidemiology to clinical practice. Long recognized for its unparalleled coverage of diagnosis, this clinical classic earned its reputation as a definitive source of information. New features of this Seventh Edition include: Two new Editors, Neil Cox and Christopher Griffiths, join the team Every chapter is updated and several are completely rewritten from scratch Completely new chapter on AIDS and the Skin Traditional emphasis on diagnosis preserved More coverage of treatment in each of the disease-specific chapters

STRATUM CORNEUM

Springer Science & Business Media The stratum corneum is a magnificent example of the successful adaptation of a tissue. Its efficient function is a prerequisite for life itself. We depend on its control of the movement of water through the skin and on its protective role in the prevention of penetration by pathogens or harmful substances. Apart from its functional importance, there is no escaping the fact that the most common skin disorders (psoriasis, eczema, inherited disorders of keratinization, acne) are 'characterised by abnormal keratinization and or scaliness. Despite all this, understanding of its chemistry, structure, physiology and involvement in disease has been sadly deficient; however, there are signs of enlightenment. This symposium is evidence of changed attitudes. Leading researchers from many countries have applied modern biomedical techniques and the methods of molecular biology to the many problems and questions posed by the stratum corneum. Although there have been several symposia and publications on the process of keratinization, few have been broadly based on the stratum corneum. For this reason we believe that the proceedings of this symposium will be invaluable for all who are professionally concerned with skin biology. Cardiff/Diisseldorf, November 1982 R. Marks G. DERMATOLOGY IN FIVE CONTINENTS

PROCEEDINGS OF THE XVII. WORLD CONGRESS OF DERMATOLOGY BERLIN, MAY 24-29, 1987

Springer Science & Business Media The World Congress of Dermatology (Congressus Mundi Dermatologiae, CMD) is held every 5 years. The purpose of this meeting is to review and summarize the present status of scientific knowledge in clinical dermatology and to in related basic research, to discuss recent results and ideas among colleagues and to contribute to the development of new clinical and scientific research programmes for the future. It is evident that the Proceedings of such a meeting, where major dermatological work from five continents is presented, should be reviewed carefully and published as soon as possible. This volume includes the reports of several hundreds of speakers from all over the world as presented during the congress or delivered 6 weeks later. The moving forces behind all this were the International League of Dermatology (ILDS) with its president, Jean Civatte, its general secretary, Nils Thyresson, the members of the Executive Committee (ICD) and the German Organizing Committee with its subcommittee for the scientific programme. In addition, the chairmen of sessions, coordinators, speakers and discussants all contributed to make the 17th CMD in Berlin a full success.

PRURITUS

Springer This book provides a thorough and comprehensive reference in the management of pruritus, designed to be a convenient resource for all physicians confronted with patients suffering from itch. The Editors have recruited a board of internationally renowned experts to provide an in-depth analysis of the causes and management of pruritus, including the current concepts in pathophysiology and novel therapeutics. Acute and chronic pruritus can represent significant management issues both as a common physiological sensation and as a manifestation of dermatologic and non-dermatologic diseases. All patients suffering from itch know that it is a very awkward sensation. Unfortunately, this often significant symptom is frequently considered less severe in comparison with pain. The consequences are that research on this field has been poorer than research on pain and that pruritus is therefore more difficult to

treat. Pruritus, Second edition addresses the new concepts and discoveries that have modified our understanding of this condition. It explains the pathophysiology of itch, describes all causes, and provides guidelines for management and treatment.

Springer-Verlag Der Volksmund spricht davon, daß manche Hautkrankheit "nach innen schlagen" könne. Wir wollen uns einmal diese vorwissenschaftliche Beobachtung im Falle der Schuppenflechte zu eigen machen, wobei hier das "Innere" von bindegewebigen und knochoeren Strukturen repräsentiert wird. Phanomen und These sind evident und - als Modell faszinierender Zusammenhänge - seit 25 Jahren Mittelpunkt unseres ärztlichen Interesses und ein Schwerpunkt meiner rheumatologischen Forschung und Lehre. In der rheumatologischen Praxis wird das entsprechende nosologische Verständnis zum differentialdiagnostischen Schlüssel täglich kasuistisch erlebter symptomatologischer Zusammenhänge. Dabei erweisen sich psoriatisch verstehbare Arthritiden und Beschwerdebilder als erstaunlich häufig, zumal die Schuppenflechte ein so verbreitetes Hautleiden ist.

RETINOIDS

ADVANCES IN BASIC RESEARCH AND THERAPY

Springer Science & Business Media With the aromatic retinoic acid analog Tigason oral and intravenous pharmacokinetic studies have been performed in 5 normal volunteers. Simultaneous fitting of single i. v. and oral data to a three-compartment model assuming first-order absorption was possible. Using Nonlin parameter estimates of the single-dose data, one is able to predict the decline in

plasma levels of parent drug following cessation of a 10 days multiple dosing regimen up to 24 hours. The model is however unable to predict a phase of prolonged elimination observed beyond 24 hours. Moreover in 5 patients, who underwent chronic therapy (8-15 months), substantial plasma levels of both unchanged drug and main metabolite (corresponding carboxylic acid) were observed up to 140 days after cessation of the therapy. An apparent half-life of elimination of 80-100 days can be calculated. The drug appears to be stored at some yet unknown storage site. Investigation of metabolism of Tigason in rats and humans revealed 19 different bio transformation products thus far, most of them appearing in the urine in low amounts (20010 of dose). A few of them (mainly the acid Ro 10-1670) after conjugation to glucuronic acid are excreted in the bile in high amounts (60-80% of dose). No drug appeared unchanged in the excreta after i. v. administration to rats. References 1. Bollag W (1971) Effects of vitamin A acid (NSC-122758) on transplantable and chemically-induced tumors.
