## Anatomy and Anatomists in Early Modern Spain

*Routledge Taking the Vesalian anatomical revolution as its point of departure, this volume charts the apparent rise and fall of anatomy studies within universities in sixteenth-century Spain, focussing particularly on primary sources from 1550 to 1600. In doing so, it both clarifies the Spanish contribution to the field of anatomy and disentangles the distorted political and historiographical viewpoints emerging from previous research. Studies of early modern Iberian science have only been carried out coherently and collaboratively in the last few decades, even though fierce debates on the subject have dominated Spanish historiography for more than two centuries. In the field of anatomy studies, many uninformed and biased readings of archival sources have resulted in a very confused picture of the practice of dissection and the teaching of anatomy in the Iberian Peninsula, in which the highly complex conditions of anatomical research within Spain's national context are often oversimplified. The new empirical evidence that this book brings to light suggests a far more multifaceted narrative of Iberian Renaissance anatomy than has been presented to date.*

*SAGE This sharp, stimulating title provides a structure for thinking about, analysing and designing case study. It explores the historical, theoretical and practical bones of modern case study research, offering to social scientists a framework for understanding and working with this form of inquiry. Using detailed analysis of examples taken from across the social sciences Thomas and Myers set out, and then work through, an intricate typology of case study design to answer questions such as: How is a case study constructed? What are the required, inherent components of case study? Can a coherent structure be applied to this form of inquiry? The book grounds complex theoretical insights in real world research and includes an extended example that has been annotated line by line to take the reader through each step of understanding and conducting research using case study.*

## Books of the Body

## Anatomical Ritual and Renaissance Learning

*University of Chicago Press We usually see the Renaissance as a marked departure from older traditions, but Renaissance scholars often continued to cling to the teachings of the past. For instance, despite the evidence of their own dissections, which contradicted ancient and medieval texts, Renaissance anatomists continued to teach those outdated views for nearly two centuries. In Books of the Body, Andrea Carlino explores the nature and causes of this intellectual inertia. On the one hand, anatomical practice was constrained by a reverence for classical texts and the belief that the study of anatomy was more properly part of natural philosophy than of medicine. On the other hand, cultural resistance to dissection and dismemberment of the human body, as well as moral and social norms that governed access to cadavers and the ritual of their public display in the anatomy theater, also delayed anatomy's development. A fascinating history of both Renaissance anatomists and the bodies they dissected, this book will interest anyone studying Renaissance science, medicine, art, religion, and society.*

## Test Construction for Training Evaluation

*Abstract: Instructors of trainees in business and industry are shown the best ways to construct tests and practical applications of test items in order to identify the strengths and weaknesses of their students. Development of an evaluating plan is followed by a discussion of the usefulness of testing for all parties involved. Various types of tests are presented in detail, including essay, oral, two option alternate-response, multiple-choice, matching, and completion of fill-in tests. Assessment of acquired skill through performance testing and evaluation of training effectiveness, including sample questionnaires and forms, are discussed.*

## Communication in Construction

### Theory and Practice

*Routledge Communication within project-based environments presents special challenges. This is especially true within the construction industry, where interaction tends to be characterised by unfamiliar groups of people coming together for short periods before disbanding to work on other endeavours. This book examines communication at a number of levels ranging from interpersonal interactions between project participants to corporate communication between organizations. Several non-typical perspectives on the process of communication are introduced to encourage the reader to think about communication in a more innovative manner. The combination of differing perspectives illustrates the diversity of communication problems facing those working within project-based environments. Practical guidance is provided on possible solutions to communication problems, and a number of examples and case studies are presented.*

## Strengthening Forensic Science in the United States

### A Path Forward

*National Academies Press Scores of talented and dedicated people serve the forensic science community, performing vitally important work. However, they are often constrained by lack of adequate resources, sound policies, and national support. It is clear that change and advancements, both systematic and scientific, are needed in a number of forensic science disciplines to ensure the reliability of work, establish enforceable standards, and promote best practices with consistent application. Strengthening Forensic Science in the United States: A Path Forward provides a detailed plan for addressing these needs and suggests the creation of a new government entity, the National Institute of Forensic Science, to establish and enforce standards within the forensic science community. The benefits of improving and regulating the forensic science disciplines are clear: assisting law enforcement officials, enhancing homeland security, and reducing the risk of wrongful conviction and exoneration. Strengthening Forensic Science in the United States gives a full account of what is needed to advance the forensic science disciplines, including upgrading of systems and organizational structures, better training, widespread adoption of uniform and enforceable best practices, and mandatory certification and accreditation programs. While this book provides an essential call-to-action for congress and policy makers, it also serves as a vital tool for law enforcement agencies, criminal prosecutors and attorneys, and forensic science educators.*

## Tools for Complex Projects

CRC Press Traditional project management approaches assume that project contexts are unchanging and key factors, though complicated, are reducible to unambiguous elements for management and control. Whilst this assumption has simplified the task for writers and educators, it is increasingly being recognised that these techniques do not work in projects which may be described as complex (due to their size, technical difficulties, conflicting environmental and political constraints or poorly understood or shared goals). *Tools for Complex Projects* draws on research in the areas of project management, complexity theory and systems thinking to provide a ready reference for understanding and managing the increasing complexity of projects and programmes. The main part of the book provides a series of fourteen project tools. Some of these tools may be used at the level of the whole project life-cycle. Others may be applied ad hoc at any time. In each case, the authors provide: detailed guidelines for using the tool, information on its purpose and the types of complexity for which it is most appropriate, the theoretical background to the tool, a practical example of its use, and any necessary words of caution. This is an example of advanced project management at work; sophisticated tools that require a level of project and management expertise and offer rigorous and highly practical methods for understanding, structuring and managing the most complex of projects.

## The Hunterian Lectures in Comparative Anatomy, May and June 1837

University of Chicago Press Sir Richard Owen (1804-1892), comparative anatomist, colleague and later antagonist of Darwin, and head of the British Museum of Natural History, was a major figure in Victorian science. Yet historians of science have found Owen a difficult subject, in part because he chose not to expound his views in a major theoretical work but rather presented them through annual lectures at the Royal College of Surgeons from 1837 to 1856. Nevertheless, Owen's views on the nature of life, the relations of form and function, the meaning of fossils, and the development of species gave his contemporaries such as Lyell, Grant, Huxley, Whewell, and Darwin a set of positions with which they could agree or disagree while developing their own views. Now, for the first time, modern readers have access to the opening series of Owen's Hunterian Lectures, in which he set out the larger framework of the theoretical reflections that occupied him during the next nineteen years. Presented to the public in the two months before Darwin began his first notebook on the species question, these lectures reveal the nature of the synthesis of French, German, and British biology taking place in metropolitan London in this crucial period in nineteenth-century life science. Phillip Reid Sloan has transcribed and edited the seven surviving lectures and has written an introduction and commentary situating the work in the context of Owen's life and the scientific and intellectual life of the time. Sloan pays particular attention to Owen's early relations to the German scientific and philosophical tradition, and in this respect contributes to an understanding of the relations between science and British Romanticism. In the lectures, Owen surveys the history of comparative anatomy up to his time and develops his views on the nature of life, species duration, physiological function, and the relation between embryology and classification. One can see the degree to which transcendental anatomy and the views of Von Baer, Johannes Müller, E. G. St.-Hilaire, and Cuvier were current in London in the late 1830s. -- from back cover.
