Dietary Polyphenols and Human Health

MDPI Polyphenols are a heterogeneous group of bioactive compounds mainly found in plant-based foods. Numerous clinical and epidemiological studies have led to the result that polyphenol intake may protect against chronic diseases such as cardiovascular and neurodegenerative diseases, cancer, or type 2 diabetes, to name some. Polyphenol intake estimation can be obtained through food frequency questionnaires and nutritional biomarkers, both having their own advantages and disadvantages. Although the association between these bioactive compounds and health seems irrefutable, many questions remain still unanswered. For instance, more studies are needed to identify possible interactions and effect-modulating variables, such as smoking habit, body mass index, sex, alcohol, hormones, other foods, etc. Moreover, intestinal microbiota seems to play an important role in the metabolism of polyphenols, but it is still unclear how.

Clinical Aspects of Functional Foods and Nutraceuticals

CRC Press In the last three decades, revolutionary achievements have taken place in nutraceutical and functional food research including the introduction of a number of cutting-edge dietary supplements supported by human clinical trials and strong patents. Novel manufacturing technologies including unique extraction processes, bioavailability improvements through delivery technologies such as nanotechnology, and innovative packaging have been critical steps for their successful positioning in the marketplace and consumer acceptance worldwide. Nonetheless, mixed messages have emerged from both the scientific community and the media concerning the potential benefits of foods and nutrients in the treatment and prevention of disease. This confusion, in addition to existing marketed products making questionable health claims, have led health practitioners and consumers to become skeptical about nutritional claims of new and emerging food products. Clinical Aspects of Functional Foods and Nutraceuticals provides an extensive overview of the clinical aspects of functional foods and nutraceuticals. It contains information on both nutritional challenges and potential health benefits of functional foods and nutraceuticals. In addition to exploring the underpinning science, the book also focuses on food innovation, functional foods in human health, food-drug interactions, functional foods in medicine, the seed-to-clinic approach, global regulatory frameworks, challenges, and future directions. The book provides an essential overview of the clinical aspects surrounding functional foods and nutraceuticals for key stakeholders, drawing links between areas of knowledge that are often isolated from each other. This form of knowledge integration will be essential for practice, especially for policy makers and administrators.

Spanish Aid in Clinical Dietetics

Abstract: In order for nutritionists and dietitians to better serve the needs of their Hispanic clients, a dictionary-booklet describing cultural food practices of the Hispanic population is presented. Spanish eating habits are characterized by a preference for traditional ethnic foods with which they are familiar. Dietitians should be aware of long-established eating customs which generate ethnic identity and solidarity. A bilingual presentation of patient interviews, food groups, nutrition and cooking vocabulary, dietary problems, modified diets, nutrition concepts, and typical Mexican-American dishes should help nutritionists achieve better communication with this group. Diet improvement to meet nutritional goals should include frequent use of traditional foods as well as increase Hispanic exposure to American foods. A table listing the nutritive value of foods commonly available in Hispanic markets is included.

Olives and Olive Oil in Health and Disease Prevention

Academic Press Long used in sacred ceremonies and associated with good health, the nutritional and health promoting benefits of olives and olive oils have been proven by an ever-increasing body of science. From cardiovascular benefits to anti-microbial, anti-cancer, antioxidant activity and effects on macrophages and apoptosis to cellular and pathophysiological process, olives and olive oils are proving important in many healthful ways. For example, reactive components in olive oils or olive oil by-products have now been isolated and identified. These include tyrosol, hydroxytyrosol, 3,4-dihydroxyphenyl acetic acid, elenolic acid and oleuropein. Oleic acid is the main monosaturated fatty acid of olive oil. These have putative protective effects and modulate the biochemistry of a variety of cell types including those of the vascular system. Some but not all components have been characterised by their putative pharmacological properties. It is possible that usage of these aforementioned products may have beneficial application in other disease. However, in order for this cross-fertilization to take place, a comprehensive understanding of olives and olive oils is required. Finding this knowledge in a single volume provides a key resource for scientists in a variety of food and nutritional roles. Key Features: * Explores olives and olive oil from their general aspects to the detailed level of important micro- and micronutrients * Includes coverage of various methodologies for analysis to help scientists and chemists determine the most appropriate option for their own studies, including those of olive-related compounds in other foods * Relates, in a single volume resource, information for food and nutritional chemists, pharmaceutical scientists, nutritionists and dieticians * Presents information in three key categories: General aspects of olives and olive oils; Nutritional, pharmacological and metabolic properties of olives and olive oil; Specific components of olive oil and their effects on tissue and body systems

Fatty Acids and Cardiometabolic Health

MDPI The impact of fat intake on hypercholesterolemia and related atherosclerotic cardiovascular diseases has been studied for decades. However, the current evidence base suggests that fatty acids also influences cardiometabolic diseases through other mechanisms including effects on glucose metabolism, body fat distribution, blood pressure, inflammation, and heart rate.

Furthermore, studies evaluating single fatty acids have challenged the simplistic view of shared health effects within fatty acid groups categorized by degree of saturation. In addition, investigations of endogenous fatty acid metabolism, including genetic studies of fatty acid metabolizing enzymes, and the identification of novel metabolically derived fatty acids have further increased the complexity of fatty acids' health impacts. This Special Issue aims to include original research and up-to-date reviews on genetic and dietary modulation of fatty acids, and the role and function of dietary and metabolically derived fatty acids in cardiometabolic health.

Policies and Strategies in Sexual and Reproductive Health

MDPI The topics covered in the book cover different aspects of sexual and reproductive health. This book provides novel research results that may be essential as a basis for the development of health policies and strategies in sexual and reproductive health. These policies are necessary to achieve greater health protection. Among others, issues as important as the increase in STIs, their risk factors, vulnerable situations and populations, as well as the issue of priority in reproductive health, such as the care that must be provided during pregnancy and childbirth in order to guarantee healthy women and children, are developed in the book. There is no doubt that women should be the preferential recipients of these health policies and strategies and, therefore, pathologies that have an impact on their quality of life as well as the situations of gender violence that these women experience also occupy a place within the content of this book. In this book, you can find interesting results allowing researchers to take into account in proposing new lines of research, students and academics to receive and transmit the most current and relevant knowledge, political leaders to develop adequate and efficient health policies and strategies, and clinical health professionals to work in clinical practice with the best available scientific evidence.
